

Various improvements, such as

- The 'Most used account assignment' can now also be displayed for the document type 'Credit note (received)'.
- The 'Validations' can be used to check the IBAN check digit from the 'IBAN' field (payment instructions).
- Suggestions: The order of the instructions can be subsequently shifted.

Group mapping for SSO configuration accessible to all

Group mapping in the SSO configuration has been enabled for all users with a Large subscription. This means that all organisations that have set up SSO can manage access directly in the IDP. During the SSO login to DeepCloud, the defined groups are synchronised according to the configuration in the IDP and the accesses are updated accordingly. The prerequisite is that the groups are configured accordingly in the IDP and transmitted to DeepCloud.

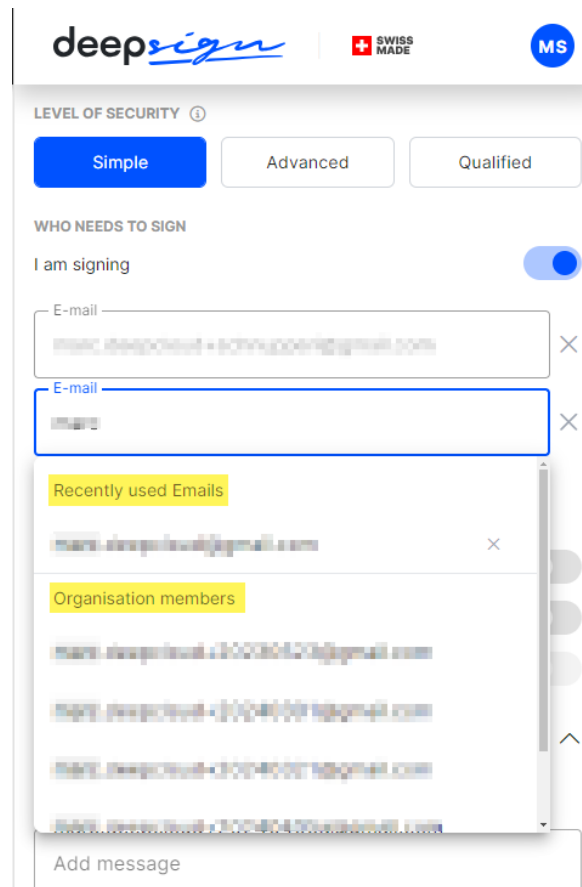

Further information can be found on our support page (currently only available in German): <https://support.deepbox.swiss/videos/grundlagen/features/sso-konfiguration/sso-group-mapping/>

Improvement when resetting the password and 2FA from DeepAdmin

The process to reset your password or change the two-factor authentication (2FA) from DeepAdmin has been improved and security has been increased.

Suggestions for signatories and observers

Suggestions for email addresses are now displayed in DeepSign 'Draft' mode. On the one hand, recently used email addresses are listed as suggestions and, on the other hand, email addresses of users from your own organisation are also suggested. Suggestions can be cleared by clicking on the 'x' next to the most recently used emails. This function is available for entering signatories and observers.

Various bug fixes and improvements, such as

- Various improvements in the seal configuration
- Optimizations to the visual seal
- Improvements to the e-mail notification of signed documents: If, for example, only the initiator signs, this no longer triggers an e-mail about the successful signature
